Thursday, October 21st

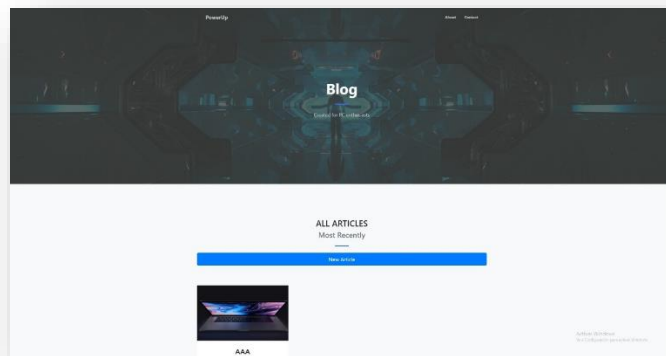

Today we began by designing the basic layout of our website and planned what pages we would include, and settled on

1. Home Page
2. Four blog posts
3. About Us page
4. Contact Us page

We created a rough sketch of said pages using an iPad and exported the document as a PDF, then started working on the HTML files with said PDF as a base.

First, we began work on the Home Page, we used a Start Bootstrap template and modified it to the point where we were satisfied with the result.

Friday, October 22nd

Today we set up our Git repository in order to work in parallel more easily. This significantly sped up our workflow since we do not need to keep sending each other files in order to modify them.

We began working on the “new post” pages by getting to understand express better. We discovered that using `.ejs` was the most efficient way to perform this task. Then we programmed all the buttons and forms to make them work correctly and let us edit all blog posts without any issues.

Saturday, October 23rd

We used several templates from the website "Start Bootstrap" named Agency, Creative and Clean Blog Angular to use them for the header, navbar and the article grid

Sunday, October 24th

Today we managed to homogenize the design for both the “new post” and “edit post” pages by applying the styles used for the other pages, finally adding consistency across the entire blog.

Monday, October 25th

We finished the design on every site and is ready to be delivered.
