Web Application Development

Self-assessment

Emilio Cisneros

I think I worked pretty well in this project, I was able to understand the way the backend works and how to take any request and make changes in your document. I achieved everything that I wanted in this project which was being able to receive the inputs in the forms and be able to retrieve the data from those forms. I was confused at the beginning of the project but then as I was working on the backend understood many things that I didn't before.

Miguel Ferrer

I would say that this project was finished in time because we were more organized. About what I did, my main goals were to oversee the main design of almost all pages of the blog, from the index to the creation and edit of an article. I consider that I put more effort on this website than the last one of the art auctions. This project helped us to understand how the most important libraries of JS can help the developer, and I hope that, with this project, we're more prepared for the final assessment.

Manuel Solano

In this project I was the one who proposed the basic layout and structure of the website. I also implemented the basic layout of the site on HTML and added basic Bootstrap elements. However, we later decided to scrap the design and go with a Bootstrap template and modify it to fit our needs. Along the duration of the project, I proposed content and added creative input, as well as wrote the development log.

Peer's Assessment

Emilio Cisneros

- Manuel Solano

He helped in giving us the basic design of the blog, he also created the contact and about us pages, he helped a lot in making the web page more appealing and functional. He also added more content to the blog.

- Miguel Ferrer

Miguel helped in finishing the project, by giving it a style and putting everything in order and in its place, he also gave it a better look with the css and helped fixing some bugs that the backend had.

Miguel Ferrer

- Emilio Cisneros:

He worked entirely on the whole back end all by himself and helped us understand what the code was about. He also provided help on bugs and actively participate on design choices, for example, we decided to remove the side bar on the index thanks to his advice.

- Manuel Solano:

He gave the blog an identity to be dedicated to the computer industry, he designed the early layout, added content on the pages "about" and "contact" pages, helped us write the development log and check if the website had any issues on design and functionality.

Manuel Solano

- Emilio Cisneros:

His work on implementing the "new blog" and "new post" were essential for the advancement of this project, and along with Miguel's work on the CSS file, he helped get the website's aesthetic close to the intended original design.

- Miguel Ferrer:

Miguel was the one who developed the backbone of the blog by creating the project, adding Express and creating the Github repo. He was also incredibly dedicated and added his personal touch to the design of the blog that I proposed, giving it a more professional look.
